"Accept a payment"- Integration:

Building a checkout form for the web and making payments through Integration with Stripe API was an easy and efficient experience. Stripe guide document is very comprehensive with simple getting started instructions and examples, categorized by frontend, backend and different platforms. I also loved exploring the followings:

a. **New guide format:** Makes the integration experience extra efficient by showing a visual layout next to the guide content with dynamic navigation as going through the document.

b. **Send an email receipt:** This feature makes the integration experience customized for Stripe's customers and also enriches their user's shopping experience by giving them individual receipts.

Minor improvement suggestions on "**Accept a payment"- Testing** :

1. **Stripe Docs**- Testing: Showing expected outcomes for each test case can increase efficiency in "user's testing experience".

Test case	Expected outcome
Payment Completed	Succeeded
Payment requires authentication- Complete Authentication	Succeeded
Payment requires authentication- Fail Authentication	Incomplete
Payment is declined (Insufficient funds)	Failed

2. **Dashboard**- Adding a column to identify test cases for each row.
   - Payment succeeds
   - Payment requires authentication
       - Complete Authentication
       - Fail Authentication
   - Payment is declined (Insufficient funds)
